

## REMARKS

Applicant made an inadvertent error in SEQ ID NO: 1 in the specification (see page 40 of the pending U.S. Provisional Patent Application No. 60/458,946 to which this application claims priority). SEQ ID NO:1 is a full-length amino acid sequence of a wild-type human PDE1B. This sequence was published prior to the filing date of the pending provisional referred to above, e.g., see Cell. Signal. 9:519-526, specifically, page 522 (1997) (attached for the Examiner's convenience). This paper is described in the specification of the pending provisional noted above, together with the specification of the application being filed concurrent herewith, e.g., see page 3, line 13 (pending provisional) and page 3, line 17 (application being filed concurrent herewith). Applicant inadvertently listed the first 60 amino acids at the end of the sequence versus in their rightful place at the beginning, as amino acids 1-60. Applicant is filing this preliminary amendment to merely correct the positioning of the first 60 amino acids. As the Examiner will fully appreciate, no new matter is being added by this amendment, given that Applicant had described the above article in the specification of the pending provisional to which the application being filed concurrent herewith claims priority. Pending entry of the amendment, SEQ ID NO:1, once again, a sequence in the public domain prior to the filing date of the pending provisional to which the application being filed concurrent herewith claims priority will now correctly reflect the sequence published in the above noted article.

Applicant regrets any inconvenience to the Examiner due to Applicant's inadvertent error, and respectfully requests entry of the amendment hereinabove, and an early examination and allowance of the claims.

Date: 3/31/04

Respectfully submitted,

Irene M. Reininger  
Attorney for Applicant  
Reg. No. 48,439

Pfizer Inc  
Eastern Point Road MS 8260-1611

FIGURE 1. Nucleotide and predicted protein sequence of HSPDE1B1 cDNA. The cDNA sequence shown was constructed from overlapping sequences of clones FB56a (nucleotides 1–698) and FB29a (nucleotides 285–2644) isolated from a human foetal brain cDNA library. Nucleotide residues are numbered on the right. The predicted amino acid sequence is represented by single letter amino acid code beneath the nucleotide sequence and is numbered on the left.

of approximately 750 bp is obtained due to the presence of intronic sequences between the primers. No product of the expected size is obtained when either mouse or hamster genomic DNA is used as template.

PCR (12.5  $\mu$ l) was carried out with 0.1 U Taq Polymerase, 0.2 mM dNTPs, and 10  $\mu$ g/ml of each primer in standard reaction buffer (Boehringer Mannheim). Somatic cell hybrid DNA (0.25  $\mu$ l, representing 61–93 ng) was added as
